FREE GUIDE

N8N LOCAL INSTALLATION

Apne laptop par N8N, bilkul free

- Zero se shuru, coding ki zaroorat nahi
- Har click, har command, step by step
- Windows aur Mac dono ke liye
- Galti ho jaaye toh uska ilaaj bhi

Guide by
Swapnil Tiwari
Founder, AI Gurukool

SHURU KARNE SE PEHLE

N8N hai kya, aur local kyun?

N8N ek automation tool hai. Aap boxes (jinhe "nodes" kehte hain) ko line se jodte ho, aur kaam apne aap hone lagta hai. Jaise: form bhara gaya, toh Google Sheet mein entry, aur WhatsApp par message. Bina coding ke.

Local install matlab: N8N aapke apne laptop par chalega. Koi monthly fees nahi, aapka data aapke paas. Seekhne aur practice ke liye ye sabse badhiya tareeka hai.

Aapko kya chahiye

Laptop
Windows 10 (22H2) ya Windows 11, 64-bit. Ya koi Mac.

RAM
8 GB ya zyada. 4 GB par bahut slow chalega.

Internet
Lagbhag 2 GB download hoga (Docker + N8N).

Samay
Pehli baar 30 se 45 minute. Chai saath rakhiye.

Do raaste hain. Aap kaunsa lein?

	Raasta A: Docker (recommended)	Raasta B: Node.js (quick try)
Kiske liye	Jo N8N regularly use karna chahte hain	Jo bas 10 minute mein jhalak dekhna chahte hain
Mushkil	Thoda lamba, par ek baar ka kaam	Sabse aasan
Future	N8N officially isi ko support karta hai	N8N 3.0 se ye tareeka band ho raha hai
Page	Page 4 se 9 (Windows), Page 10 (Mac)	Page 11

Swapnil ki salah

Agar aap seriously automation seekhna chahte ho, toh seedha **Raasta A (Docker)** lo. Ek baar set ho gaya, toh roz bas ek click mein N8N chalu.

5 SHABD, AASAN BHASHA MEIN

Pehle ye words samajh lo

Shabd	Matlab (desi example ke saath)
Terminal / PowerShell	Kaala window jahan aap laptop ko **type karke** order dete ho. Mouse ki jagah keyboard.
Command	Ek line ka order. Copy karo, paste karo, **Enter** dabao. Bas.
Docker	Ek **tiffin box**. N8N ko uske saare saamaan ke saath ek dabbe mein pack karke chalata hai, taaki aapke laptop mein kuch gadbad na ho.
Container	Wo chalta hua tiffin. Hamara container ka naam hoga `n8n`.
Volume	Ek **almirah** jahan aapke workflows safe rakhe jaate hain. Tiffin band ho jaaye, almirah ka saamaan safe rehta hai.
Port 5678	Ghar ka **darwaza number**. N8N is darwaze par milega: `localhost:5678`
localhost	"Mera apna laptop". Internet ki koi website nahi.

Terminal kaise kholein

Windows: PowerShell

1. Keyboard par **Windows key** dabao
2. Type karo: **PowerShell**
3. Normal kaam ke liye: click karke kholo
4. "Administrator" chahiye toh: right-click > **Run as administrator**

Mac: Terminal

1. **Cmd + Space** dabao
2. Type karo: **Terminal**
3. Enter dabao

Windows PowerShell

```
PS C:\Users\Aap> _   ⟵ yahan command paste karke Enter dabana hai
```

Copy-paste ka zaroori niyam

- Is guide mein **peeli (yellow) line** hi command hai. Sirf wahi copy karna, `PS C:\Users\Aap>` wala hissa nahi.
- PDF se copy karne par lambi command kabhi 2 line mein toot jaati hai. Isliye saari commands ek text file mein bhi rakhi hain, wahan se copy karo: **aigurukool.in/g/n8n-commands-k7×2.txt**
- PowerShell mein paste: **Ctrl + V** ya right-click.

RAASTA A · WINDOWS

Docker se N8N: Step by step

1 Laptop check karo

2 min

(a) Windows version: Windows key dabao, type karo `winver`, Enter. Window mein "Version 22H2" (Windows 10) ya "Windows 11" dikhna chahiye.

(b) RAM: Settings > System > About > "Installed RAM". 8 GB ya zyada ho toh perfect.

(c) Virtualization ON hai ya nahi: Ctrl + Shift + Esc se Task Manager kholo > **Performance** tab > **CPU**. Neeche right side mein likha hoga:

Task Manager > Performance > CPU

```
Base speed:      2.40 GHz
Cores:           8
Virtualization:  Enabled   ⟵ ye "Enabled" hona chahiye
```

"Disabled" likha hai?

Laptop restart karke BIOS mein jaana padega (zyaatar F2, F10 ya Del key, company ke hisaab se). Wahan "Intel VT-x" ya "AMD-V / SVM" ko **Enabled** karo. Ye setting har laptop mein alag jagah hoti hai, apne laptop model ka naam + "enable virtualization" Google kar lo.

2 WSL install karo

5 to 10 min

WSL Windows ke andar ek chhota Linux hai. Docker ko chalne ke liye iski zaroorat hoti hai.

PowerShell ko "Run as administrator" se kholo (Page 3 dekho) aur ye command chalao:

Administrator: Windows PowerShell

```
PS C:\Windows\system32> wsl --install
Installing: Virtual Machine Platform ...
Installing: Windows Subsystem for Linux ...
Installing: Ubuntu ...
The requested operation is successful. Changes will not be effective until the system is rebo
oted.
```

- Install ke baad **laptop restart karo.**
- Restart ke baad ek Ubuntu window khul sakti hai jo username aur password maangegi. Koi bhi simple naam aur password daal do (password type karte waqt screen par kuch nahi dikhega, ye normal hai).

WSL pehle se hai?

Toh bas update kar lo: `wsl --update`

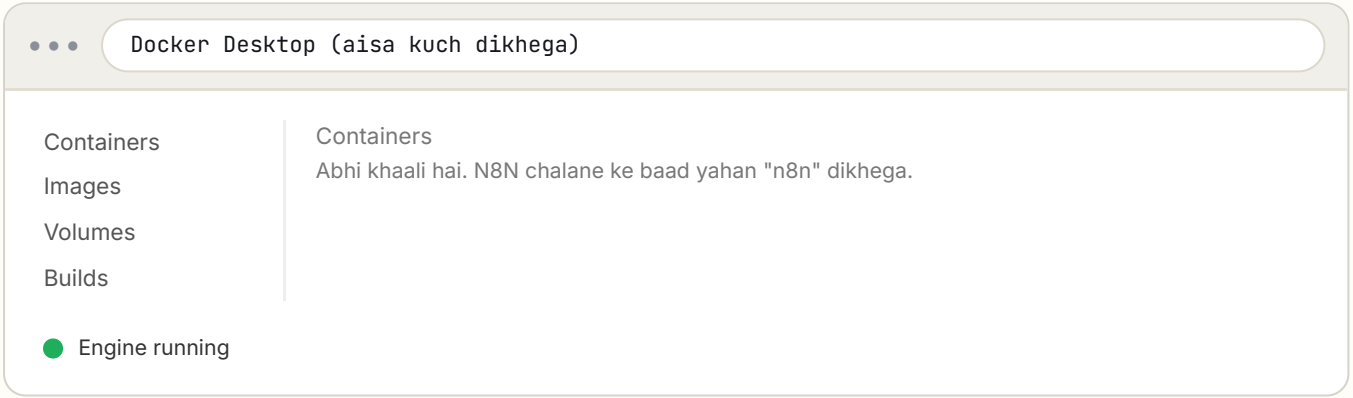

RAASTA A · WINDOWS

3 Docker Desktop install karo

10 to 15 min

Docker Desktop wo app hai jo hamara "tiffin box" (container) chalata hai. Personal use aur chhote business ke liye free hai.

1. Browser mein kholo: **docker.com/products/docker-desktop**
2. **Download for Windows - AMD64** par click karo. (Aapka laptop Intel ya AMD ka hai toh yahi wala. Bahut kam laptops "ARM" hote hain.)
3. Download hui file **Docker Desktop Installer.exe** par double-click karo.
4. Installer mein **"Use WSL 2 instead of Hyper-V"** wala box ticked rehne do. **OK** dabao.
5. Install poora hone par **Close and restart** (ya laptop restart) karo.
6. Restart ke baad Docker Desktop kholo. Terms par **Accept** karo.
7. Sign in / Sign up maange toh **Skip** kar sakte ho. Account zaroori nahi hai.
8. Neeche left corner mein **"Engine running"** (hara/green) dikhe, matlab Docker taiyaar hai.

Docker khulte hi error aaye?

- **"WSL needs updating"**: Admin PowerShell mein `wsl --update` chalao, phir Docker dobara kholo.
- **"Virtualization support not detected"**: Step 1(c) dobara dekho. BIOS mein virtualization ON karna hai.

Yaad rakho

N8N tabhi chalega jab **Docker Desktop khula ho**. Settings > General mein "Start Docker Desktop when you sign in" ON kar do, toh laptop on karte hi Docker apne aap chalu ho jayega.

RAASTA A · WINDOWS

4 Check karo ki Docker kaam kar raha hai

2 min

Ab normal PowerShell kholo (administrator ki zaroorat nahi). Pehli command:

Windows PowerShell

```
PS C:\Users\Aap> docker --version
Docker version 2x.x.x, build xxxxxxx   ⟵ number kuch bhi ho, chalega
```

Ab ek test tiffin chalao:

Windows PowerShell

```
PS C:\Users\Aap> docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world ...

Hello from Docker!
This message shows that your installation appears to be working correctly.
```

"Hello from Docker!" dikha? Badhai ho, Docker ready hai.

"docker is not recognized" aaya?

Docker Desktop band hai ya abhi start ho raha hai. Docker Desktop kholo, "Engine running" ka wait karo, PowerShell band karke naya kholo, phir dobara try karo.

5 N8N ki almirah (volume) banao

30 sec

Yahan aapke saare workflows aur settings safe rahenge. Ye command **sirf ek baar** chalani hai:

Windows PowerShell

```
PS C:\Users\Aap> docker volume create n8n_data
n8n_data   ⟵ bas itna likha aayega, matlab almirah ban gayi
```

RAASTA A · WINDOWS · ASLI MOMENT

6 N8N chalu karo

3 to 5 min

Ye **ek hi lambi line** hai. Poori ek saath copy karo (text file se copy karna sabse safe hai: **aigurukool.in/g/n8n-commands-k7×2.txt**).

Windows PowerShell

```
PS C:\Users\Aap> docker run -d --name n8n --restart unless-stopped -p 5678:5678 -e GENERIC_TIMEZONE="Asia/Kolkata" -e TZ="Asia/Kolkata" -e N8N_ENFORCE_SETTINGS_FILE_PERMISSIONS=true -v n8n_data:/home/node/.n8n docker.n8n.io/n8nio/n8n
Unable to find image 'docker.n8n.io/n8nio/n8n:latest' locally
latest: Pulling from n8nio/n8n
...  (pehli baar download mein 2 se 5 minute)
3f9a1c6e2b7d...   ⟵ lamba sa code aaya, matlab N8N chalu ho gaya
```

Is command ka har hissa kya karta hai

Hissa	Matlab
`docker run`	Naya tiffin (container) chalao
`-d`	Background mein chalao, PowerShell free rahe
`--name n8n`	Container ka naam "n8n" rakho
`--restart unless-stopped`	Docker khulte hi N8N apne aap chalu ho jaye
`-p 5678:5678`	Darwaza number 5678 kholo
`-e GENERIC_TIMEZONE / TZ`	Time India ka (Asia/Kolkata), taaki schedule wale workflows sahi time par chalein
`-e N8N_ENFORCE_SETTINGS_FILE_PERMISSIONS=true`	Settings file ko secure rakho (N8N ki official salah)
`-v n8n_data:/home/node/.n8n`	Workflows ko almirah (volume) mein save karo
`docker.n8n.io/n8nio/n8n`	N8N ka official package

Check karna hai ki N8N zinda hai?

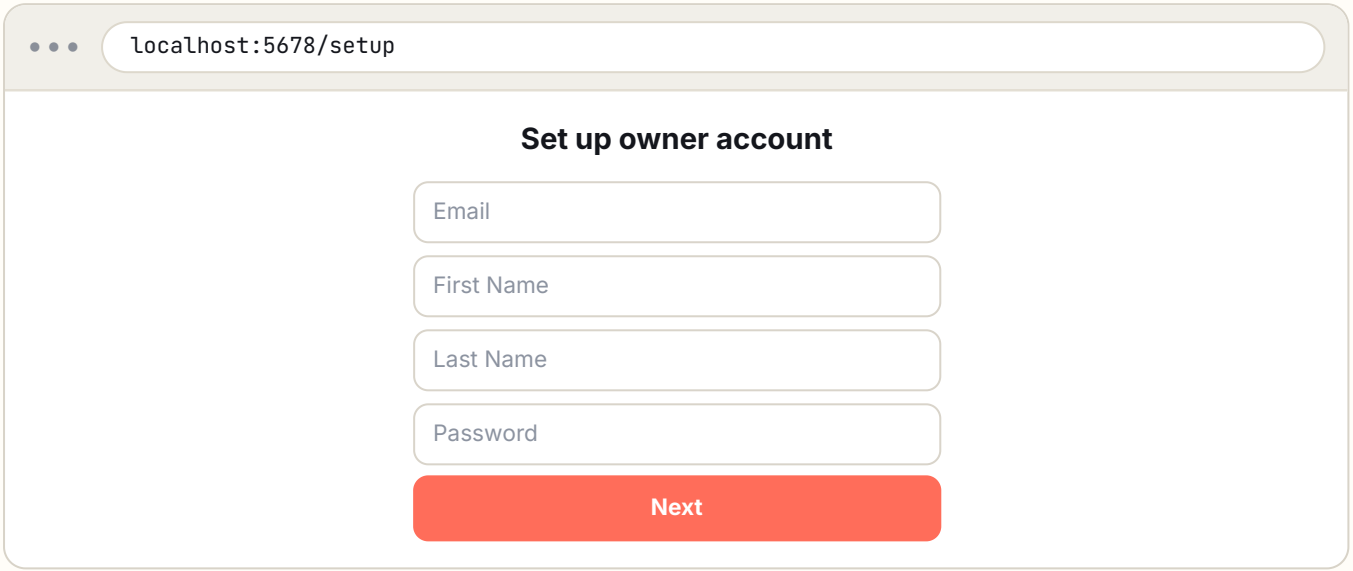

Ye command chalao: `curl.exe http://localhost:5678/healthz`
Jawab aaye `{"status":"ok"}` toh sab badhiya hai. (Pehli baar shuru hone mein 20 se 30 second lagte hain.)

RAASTA A · WINDOWS

7 Browser mein N8N kholo

2 min

Chrome ya Edge mein ye address type karo: **http://localhost:5678**

- Pehli baar N8N ek **owner account** banane ko kahega. Ye account sirf aapke laptop par hai, kahin online nahi jaata.
- Apna email, naam aur ek strong password daalo. **Password likh ke rakh lo**, baad mein yahi login karega.
- Kuch survey questions aa sakte hain, unhe bhar do ya skip karo.
- Bas! Aapke saamne N8N ka khaali canvas hai. **Aapka N8N ready hai.**

8 Roz ka use: on, off, restart

yaad rakhna

Kaam	Kaise karein
N8N chalu karna	Bas Docker Desktop kholo. N8N apne aap chalu ho jayega (Step 6 ki `--restart` setting ki wajah se). Phir browser mein **localhost:5678**
N8N band karna	Docker Desktop > Containers > n8n ke aage **Stop** button. Ya command: `docker stop n8n`
Dobara chalu karna	Containers > n8n > **Start**. Ya command: `docker start n8n`
Kya chal raha hai, dekhna	`docker ps` (list mein "n8n" dikhe toh chal raha hai)
Error ki details	`docker logs n8n`

Step 6 dobara mat chalana

Step 6 sirf **pehli baar** ke liye hai. Dobara chalaoge toh error aayega "name n8n is already in use". Roz ke liye upar wali table use karo.

RAASTA A · KUCH HAFTON BAAD

N8N ko update kaise karein

N8N har kuch hafton mein naye features laata hai. Update karne se aapke workflows **delete nahi hote**, kyunki wo almirah (volume) mein safe hain. Ye 4 commands ek-ek karke chalao:

Windows PowerShell

```
# 1. Naya version download karo
PS C:\Users\Aap> docker pull docker.n8n.io/n8nio/n8n

# 2. Purana N8N band karo
PS C:\Users\Aap> docker stop n8n

# 3. Purana tiffin hatao (almirah safe rehti hai)
PS C:\Users\Aap> docker rm n8n

# 4. Step 6 wali command dobara chalao
PS C:\Users\Aap> docker run -d --name n8n --restart unless-stopped -p 5678:5678 -e GENERIC_TI
MEZONE="Asia/Kolkata" -e TZ="Asia/Kolkata" -e N8N_ENFORCE_SETTINGS_FILE_PERMISSIONS=true -v n
8n_data:/home/node/.n8n docker.n8n.io/n8nio/n8n
```

Kabhi mat karna

`docker volume rm n8n_data` ya Docker Desktop > Volumes se "n8n_data" delete. Isse **saare workflows hamesha ke liye chale jaate hain.**

Backup ki aadat daalo

Har important workflow ko N8N ke andar se **Download** (workflow ke upar right side ka menu > Download) karke ek folder mein rakh lo. Ye ek .json file hoti hai, kabhi bhi wapas Import kar sakte ho.

RAASTA A · MAC USERS

Mac par aur bhi aasan hai

Mac par WSL ki zaroorat nahi. Bas Docker Desktop aur wahi commands.

1 Apna chip pata karo

Top-left **Apple logo > About This Mac**. "Chip: Apple M1/M2/M3/M4..." likha hai toh **Apple Silicon**. "Processor: Intel" likha hai toh **Intel**.

2 Docker Desktop install karo

1. **docker.com/products/docker-desktop** kholo, apne chip wala **Download for Mac** chuno.
2. Download hui **Docker.dmg** kholo, Docker icon ko **Applications** folder mein drag karo.
3. Applications se Docker kholo, permissions maange toh **OK** do, terms **Accept** karo. Sign in **Skip** kar sakte ho.

3 Terminal mein yahi commands

Terminal

```
aap@MacBook ~ % docker run hello-world
Hello from Docker!

aap@MacBook ~ % docker volume create n8n_data
n8n_data

aap@MacBook ~ % docker run -d --name n8n --restart unless-stopped -p 5678:5678 -e GENERIC_TIM
EZONE="Asia/Kolkata" -e TZ="Asia/Kolkata" -e N8N_ENFORCE_SETTINGS_FILE_PERMISSIONS=true -v n8
n_data:/home/node/.n8n docker.n8n.io/n8nio/n8n

aap@MacBook ~ % curl http://localhost:5678/healthz
{"status":"ok"}
```

Phir browser mein **localhost:5678** kholo aur Windows wale **Step 7 aur 8** follow karo (Page 8). Update ka tareeka bhi same hai (Page 9).

Mac/Linux shortcut (optional)

N8N ka official one-line installer bhi hai, jo Docker check karke sab khud set karta hai: `curl -fsSL https://get.n8n.io | sh`
Beginners ke liye upar wala step-by-step tareeka behtar hai, kyunki usmein aapko pata rehta hai ki kya ho raha hai.

RAASTA B · 10 MINUTE QUICK TRY

Bina Docker, Node.js se

Pehle ye padh lo

N8N ki official docs ke hisaab se **N8N 3.0 se npm/npx wala tareeka support nahi hoga.** Isliye ise sirf "jhalak dekhne" ke liye use karo. Regular kaam ke liye Raasta A (Docker) lo.

1 Node.js install karo

5 min

1. **nodejs.org** kholo.
2. **Version 24 (LTS)** wala installer download karo. N8N ko Node **20.19 se 24.x** ke beech chahiye. Agar site par 26 ya usse naya version sabse upar dikhe, toh "Other downloads / Previous releases" se **v24** lo.
3. Installer chalao, sab default rakh ke **Next, Next, Install**.

2 Check karo

Windows PowerShell

```
PS C:\Users\Aap> node -v
v24.x.x   ⟵ 24 se shuru hona chahiye
```

3 N8N chalao

3 to 5 min

Windows PowerShell

```
PS C:\Users\Aap> npx n8n
Need to install the following packages:
n8n@x.x.x
Ok to proceed? (y) y
... (download hoga, thoda samay lagega)
Editor is now accessible via:
http://localhost:5678
```

- Browser mein **localhost:5678** kholo, Page 8 ka Step 7 follow karo.
- **Band karna:** PowerShell window mein **Ctrl + C**. Window band kar doge toh bhi N8N band ho jayega.
- **Dobara chalana:** phir se `npx n8n`

PowerShell "scripts disabled" error de?

Command Prompt (CMD) mein try karo: Windows key > type **cmd** > Enter, phir `npx n8n`.

GADBAD HO GAYI? GHABRAO MAT

Common problems ka ilaaj

Problem	Ilaaj
"docker is not recognized" / "command not found"	Docker Desktop kholo, "Engine running" ka wait karo. Phir PowerShell band karke naya kholo.
Docker: "Virtualization support not detected"	BIOS mein virtualization ON karo (Page 4, Step 1c).
Docker: "WSL update required"	Admin PowerShell mein `wsl --update`, phir laptop restart.
localhost:5678 nahi khul raha	30 second ruko, page refresh karo. Phir `docker ps` chalao, "n8n" na dikhe toh `docker start n8n`. Details ke liye `docker logs n8n`
"name n8n is already in use"	N8N pehle se bana hua hai. Bas `docker start n8n` chalao. Step 6 dobara mat chalao.
"port 5678 is already allocated"	Koi aur N8N (shayad `npx n8n` wala) chal raha hai. Use band karo (Ctrl + C) ya laptop restart karo.
Owner account ka password bhool gaye	PowerShell / Terminal mein: `docker exec -u node -it n8n n8n user-management:reset` phir `docker restart n8n`. Phir localhost:5678 par owner account dobara banana padega. Workflows safe rehte hain.
Laptop bahut slow ho gaya	Kaam na ho toh `docker stop n8n` aur Docker Desktop band kar do. 8 GB se kam RAM par ye normal hai.
Schedule wale workflows galat time par chal rahe	Step 6 mein `Asia/Kolkata` wala hissa check karo. N8N mein Settings > Personal / workflow settings mein bhi timezone dekh lo.

Phir bhi atke ho?

Error ka screenshot lekar WhatsApp channel "AI Automation ki ABC" par poochho, ya Instagram **@aigurukool** par DM karo. Official docs: **docs.n8n.io**

BONUS · 5 MINUTE

Aapka pehla workflow

Install ho gaya? Chaliye ek chhota sa workflow bana ke dekhte hain, taaki haath khul jaaye.

1. N8N mein **Create Workflow** (ya "Start from scratch") par click karo.
2. **+** button dabao, search karo **"Manual"** aur **Trigger manually** chuno. Ye workflow ka "start button" hai.
3. Uske aage wale **+** par click karo, search karo **"Edit Fields"** (Set). **Add Field** mein Name: `message`, Value: `Namaste N8N!`
4. Upar **Execute workflow** (Test workflow) dabao.
5. Edit Fields node par hara tick aayega aur output mein **"Namaste N8N!"** dikhega.

Workflow ka naksha

```
[ Trigger manually ]  ---->  [ Edit Fields: message = "Namaste N8N!" ]
        start button                  output: { "message": "Namaste N8N!" }
```

Bas! Yahi N8N ka core hai: **trigger** (kab shuru ho) + **nodes** (kya karna hai). Ab Manual ki jagah Schedule, Webhook ya Google Sheets trigger lagao, aur asli automation shuru.
